

# Debian ausrollen und konfigurieren

PXE, di-netboot-assistant, preseeding and ansible

Andreas B. Mundt  
andi@debian.org

GNU/Linux Day

19.10.2019

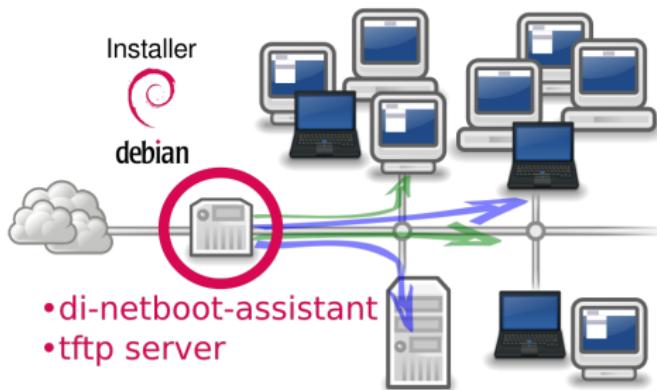

# Overview

- 1 TFTP/PXE Boot Install
- 2 `di-netboot-assistant`
- 3 Customization
  - Preseeding the Installation
  - Ansible Configuration Management
  - Combining `debian-installer/preseeding` and `ansible`
  - Playbook Examples
- 4 Summary and Questions
- 5 Workshop

# TFTP/PXE Boot Install

- Configure client to boot over the network with PXE
- Configure DHCP server to send TFTP server address
- Client fetches pxelinux.0 (legacy BIOS) or bootnetx64.efi (UEFI)
- Client fetches kernel and initramfs from TFTP server ...

⇒ Install!

# PXE boot: legacy BIOS

Client:

```
Booting from ROM...

# PXE: Legacy BIOS – UEFI

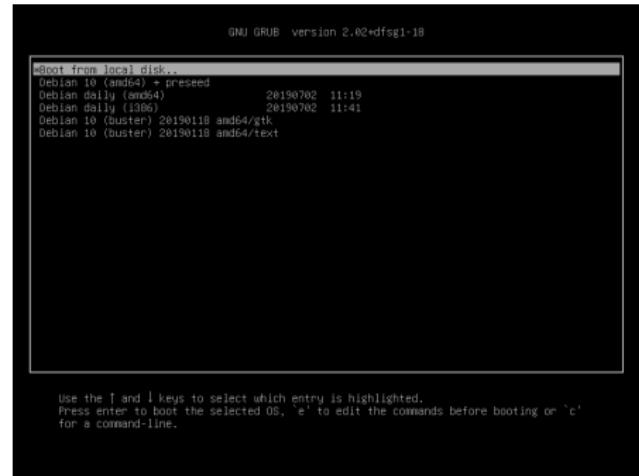

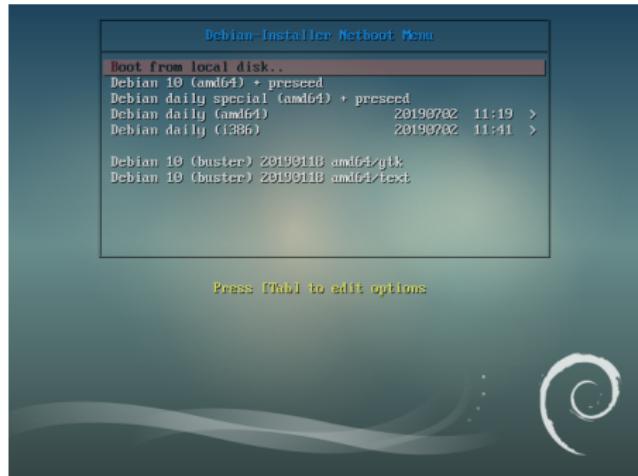

How does the client know which file to fetch?

The DHCP server sends the file path dependent on the client's identification:

- Legacy BIOS
  - ▶ PXE Linux (pxelinux.0)
  - ▶ isc-dhcp: option arch = 00:00
  - ▶ dnsmasq: dhcp-match=set:bios,option:client-arch,0
- UEFI
  - ▶ GRUB (grubx64.efi, bootnetx64.efi)
  - ▶ isc-dhcpd: option arch = 00:07
  - ▶ dnsmasq: dhcp-match=set:efi-x86\_64,option:client-arch,7

# PXE boot menu (examples)

# Overview

1 TFTP/PXE Boot Install

2 **di-netboot-assistant**

3 Customization

4 Summary and Questions

5 Workshop

## Debian-Installer netboot assistant package:

- Simplify the preparation of files for TFTP net booting.
- Download and extract files needed and organize them.
- Support PXElinux and grub-efi.
- Prepare a top level menu.
- Add non-free firmware to the installer images.
- Support for preseeding the installer.
- Support for ansible/ansible-pull.

## “News” from the di-netboot-assistant changelog:

- Implement the inclusion of debian-installer packages.
- Implement signature verification for images.
- Implement EFI boot with grub EFI image.
- Add download date and time to PXE-menu entries.
- Implement autopkgtest.
- Updates, improvements and new/more examples.
- Add u-boot pxe menu for arm systems.
- Add example ‘installbox’.

... what images are available? ...

### Installation:

```
apt install di-netboot-assistant \
# -t stretch-backports \
# --no-install-recommends
```

Let's run `di-netboot-assistant`!

```
$ di-netboot-assistant install
```

E: No repository name was passed for 'install'.

I: Declared repositories are:

bullseye bullseye-gtk buster buster-gtk daily daily-gtk  
jessie jessie-gtk oldstable oldstable-gtk precise stable  
stable-gtk stretch stretch-gtk testing testing-gtk trusty  
vivid wheezy wheezy-gtk wily xenial yakkety zesty

## ... install some images ...

```
# di-netboot-assistant install stable testing
I: Processing stable/amd64.
I: Downloading 'SHA256SUMS'.
I: Good signature from "Debian Archive Automatic Signing Key
[...]
I: Building menu entries for the netboot-images.
I: • stable-amd64
I: Using splash screen from 'stable' image.
[...]
I: Building menu entries for the netboot-images.
I: • stable-amd64
I: • testing-amd64
I: Building menu entries for debian-installer--netboot-* packages.
[...]
```

... add firmware ...

```
di-netboot-assistant fw-toggle stable
```

```
I: Processing non-free firmware for stable/amd64.
```

```
I: Downloading 'SHA256SUMS'.
```

```
[...]
```

```
I: Downloading 'firmware.cpio.gz'.
```

```
I: Adding non-free firmware.
```

```
ls -l /var/lib/tftp/d-i/n-a/stable/amd64/
```

```

Press [Tab] to edit options

# ... enjoy the sub menus:

## Example 'installbox' (README.installbox)

### Preparations for the installbox:

```
## Install packages, stop dnsmasq and prevent it from starting at boot:  
# apt install di-netboot-assistant dnsmasq nftables \  
#                               debian-installer-netboot-amd64  
# systemctl stop dnsmasq  
# systemctl disable dnsmasq  
# cp /usr/share/doc/di-netboot-assistant/examples/dnsmasq.conf.simple \  
#                               /etc/dnsmasq.d/netboot-installer  
  
## Prepare location for debian-installer-netboot-amd64 images:  
# mkdir -p /var/lib/tftpboot/d-i/n-pkg/
```

# Example 'installbox' (README.installbox)

Temporary convert to an installbox:

```
LAN_IF="${LAN_IF:-enp2s0}"

## Make packaged installer files available:
mount -o bind,ro /usr/lib/debian-installer/ /var/lib/tftpboot/d-i/n-pkg/
di-netboot-assistant install daily

## Configure the netboot interface:
ip address add 192.168.0.10/24 dev $LAN_IF
ip link set $LAN_IF up

## Enable forwarding:
sysctl -w net.ipv4.ip_forward=1

## Configure masquerading:
nft add table nat
nft add chain nat prerouting { type nat hook prerouting priority 0 \; }
nft add chain nat postrouting { type nat hook postrouting priority 100 \; }
nft add rule nat postrouting masquerade

## Provide DNS, DHCP and a TFTP server for the netboot clients:
systemctl start dnsmasq
```

# Customization

1 TFTP/PXE Boot Install

2 di-netboot-assistant

3 Customization

- Preseeding the Installation
- Ansible Configuration Management
- Combining debian-installer/preseeding and ansible
- Playbook Examples

4 Summary and Questions

5 Workshop

# Preseeding the Installation

preseeding = answer installer questions in advance

How?  $\implies$  provide preconfiguration/preseed-file

Methods:

- initrd
- file
- network
  - ▶ http
  - ▶ tftp
- boot parameters

# Preseeding with di-netboot-assistant

Customized boot options (pxelinux.HEAD/grub.cfg.HEAD):

```
/etc/di-netboot-assistant/pxelinux.HEAD

DEFAULT bootlocal
TIMEOUT 10
# ######
# Install stable automatically.
# For details consult
#           '/usr/share/doc/di-netboot-assistant/README.preseed'.
#
LABEL autoinstall
    MENU LABEL Debian stable (amd64) + preseed
    kernel ::/d-i/n-a/stable/amd64/linux
    append initrd=::/d-i/n-a/stable/amd64/initrd.gz \
        auto=true priority=critical url=tftp://installbox \
        playbook=ANSIBLEPLAYBOOK ---
#
# ######
```

# Preparing the Preseed File

- Example preseed file:

/usr/share/doc/di-netboot-assistant/examples/preseed.cfg

- Use TFTP server:

Prepare \$TFTP\_ROOT/d-i/buster/:

```
# mkdir -p /var/lib/tftpboot/d-i/buster/
# cp /usr/share/doc/di-netboot-assistant/examples/preseed.cfg \
      /var/lib/tftpboot/d-i/buster/
```

- Modify the preseed file to your needs:

- ▶ localization
- ▶ partitioning
- ▶ ssh public key

- Make sure the TFTP server is found (DNS or use IP address)

Preseeding a complete system is rather complicated and hard to maintain.

# Ansible Configuration Management

1 TFTP/PXE Boot Install

2 di-netboot-assistant

3 Customization

- Preseeding the Installation
- Ansible Configuration Management
- Combining debian-installer/preseeding and ansible
- Playbook Examples

4 Summary and Questions

5 Workshop

# Configuration Management: Ansible Basics

hosts, group of hosts;  
roles: tasks, files, templates, handlers;  
playbooks

`ansible-playbook`

- private/public key ssh login into client as root or sudo user
- run playbooks (configuration space) on the client (push config)

`ansible-pull`

- client fetches playbooks (configuration space) from the network
- implement the relevant playbooks on the client (pull config)

# Combining debian-installer/preseeding and ansible

Idea:

- Only preseed the minimal necessary options.
- Further set up the system from ansible playbooks.

Advantages:

- Preseeding is done once for all.
- Configuration management system's advantages (roles, logging, ...).

An even better idea: Use ansible-pull during the installation.

- Same source of configuration during and after installation.
- Installation to the final system state is done in one step.

# Combining debian-installer/preseeding and ansible

Idea:

- Only preseed the minimal necessary options.
- Further set up the system from ansible playbooks.

Advantages:

- Preseeding is done once for all.
- Configuration management system's advantages (roles, logging, ...).

An even better idea: Use ansible-pull during the installation.

- Same source of configuration during and after installation.
- Installation to the final system state is done in one step.

# Implementation with ansible-pull

## Preseed file:

```
### Individual additional packages to install
d-i pkgsel/include string firmware-linux ansible git
[...]
### This command is run just before the install finishes:
d-i preseed/late_command string \
    mkdir -p /target/home/ansible/.ssh && \
    echo "ssh-rsa YOURSSHKEYHERE ansible@installbox" \
        >> /target/home/ansible/.ssh/authorized_keys ; \
    in-target chown -R ansible:ansible /home/ansible/.ssh/ ; \
    in-target chmod -R og= /home/ansible/.ssh/ ; \
in-target ansible-pull --verbose --purge \
-i localhost, --url=git://installbox/.git $playbook
```

## Export ansible playbook on installbox:

```
git daemon --verbose --export-all
--base-path=/dir/of/playbook -- /dir/of/playbook
```

## di-netboot-assistant playbook menu

Boot options (pxelinux.HEAD/grub.cfg.HEAD):

```
/etc/di-netboot-assistant/pxelinux.HEAD
```

```
MENU LABEL Debian stable (amd64) + preseed + WEB SERVER
kernel ::/d-i/n-a/stable/amd64/linux
append initrd=::/d-i/n-a/stable/amd64/initrd.gz \
        auto=true priority=critical url=tftp://installbox \
        playbook=webserver ---
```

```
MENU LABEL Debian testing (amd64) + preseed + DESKTOP
kernel ::/d-i/n-a/stable/amd64/linux
append initrd=::/d-i/n-a/stable/amd64/initrd.gz \
        auto=true priority=critical url=tftp://installbox \
        playbook=desktop ---
```

...

# Playbook Examples

A few ansible playbook examples are provided here:

<https://salsa.debian.org/andi/debian-lan-ansible>

```
git clone https://salsa.debian.org/andi/debian-lan-ansible.git
```

Contributions like patches, suggestions, pull requests and/or further profiles are highly appreciated!

# Playbook Examples

- Installbox:

- ▶ set up as gateway to some external network (WAN)
- ▶ providing TFTP installation on the LAN interface
- ▶ automatic installs: preseeding and ansible playbooks
- ▶ squid package cache

use case: orchestration of automatic installs in the LAN

- Kiosk:

- ▶ auto login user
- ▶ reasonable defaults
- ▶ temporary home directory on tmpfs, reset at boot

use case: school's computer, hackerspace, ...

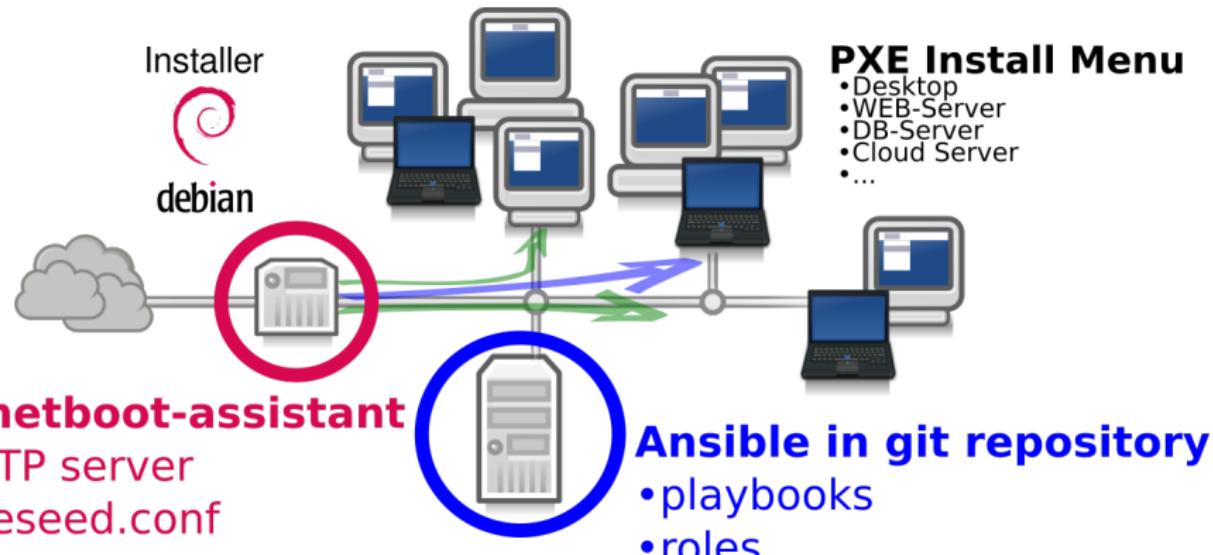

- Cloudbox:

- ▶ setup of a home cloud server
- ▶ dynamic DNS name
- ▶ ...

use case: nextcloud server in the basement
