

apt install YOUR-NEIGHBORHOOD

Automatic Installation of Debian GNU/Linux

Andreas B. Mundt
andi@debian.org

How to install and configure Debian GNU/Linux?

- fetch installer media
- run the installation

- boot the system
- manual configuration

... what about more and more installations ... ???

Idea:

InstallBox

Overview

- 1 Introduction and Motivation
- 2 The InstallBox: Installation and Configuration
- 3 Preseeding
- 4 Debian-LAN: Fully Automatic Installation with FAI
- 5 Summary and Conclusions

- **(Virtual) Hardware**

- ▶ 2 NICs
- ▶ ~ 10 GiB disk space

- **Network Configuration**

- ▶ external network (WAN): DHCP
- ▶ internal network (LAN): 192.168.0.0/24

- **Debian Netboot Installer**

- ▶ PXE boot, netinstall
- ▶ boot menu: amd64, i386, ...

- **Services (LAN)**

- ▶ DHCP, DNS and TFTP
- ▶ package cache

- **(Virtual) Hardware**

- ▶ 2 NICs
- ▶ ~ 10 GiB disk space

- **Network Configuration**

- ▶ external network (WAN):
DHCP
- ▶ internal network (LAN):
192.168.0.0/24

- **Debian Netboot Installer**

- ▶ PXE boot, netinstall
- ▶ boot menu: amd64, i386, ...

Overview

- 1 Introduction and Motivation
- 2 The InstallBox: Installation and Configuration
 - DHCP and DNS: dnsmasq
 - TFTP and Netboot Installer: di-netboot-assistant
 - IP-Forwarding: shorewall
 - Redirection and Package Cache: squid
- 3 Preseeding
- 4 Debian-LAN: Fully Automatic Installation with FAI
- 5 Summary and Conclusions

DHCP and DNS: preparations

Start with a standard jessie installation (ssh-server but no desktop):

- eth0 is connected to the internet (DHCP)
- eth1 is not yet connected

After first boot:

Install etckeeper:

```
apt install etckeeper
```

Append static configuration for internal (LAN) interface:

```
cat >> /etc/network/interfaces <<EOF
allow-hotplug eth1
iface eth1 inet static
    address 192.168.0.10
    netmask 255.255.255.0
EOF
```

DHCP and DNS: preparations

Start with a standard jessie installation (ssh-server but no desktop):

- eth0 is connected to the internet (DHCP)
- eth1 is not yet connected

After first boot:

Install etckeeper:

```
apt install etckeeper
```

Append static configuration for internal (LAN) interface:

```
cat >> /etc/network/interfaces <<EOF
allow-hotplug eth1
iface eth1 inet static
    address 192.168.0.10
    netmask 255.255.255.0
EOF
```

DHCP and DNS: install and configure dnsmasq

Install dnsmasq:

```
apt install dnsmasq
```

Modifications in /etc/dnsmasq.conf:

```
-#interface=
```

```
+interface=eth1
```

```
-#dhcp-range=192.168.0.50,192.168.0.150,12h
```

```
+dhcp-range=192.168.0.50,192.168.0.150,2h
```

TFTP and Netboot Installer: di-netboot-assistant

Install and prepare di-netboot-assistant:

```
apt install di-netboot-assistant
mkdir /var/lib/tftpboot
di-netboot-assistant install jessie
di-netboot-assistant install jessie --arch=i386
```

Configure dnsmasq' built-in tftp server in /etc/dnsmasq.conf:

```
-#dhcp-boot=pxelinux.0
+dhcp-boot=debian-installer/pxelinux.0

-#enable-tftp
+enable-tftp

-#tftp-root=/var/ftpd
+tftp-root=/var/lib/tftpboot
```

Summary: Effective /etc/dnsmasq.conf

```
grep -vE "(#|$)" /etc/dnsmasq.conf  
interface=eth1  
dhcp-range=192.168.0.50,192.168.0.150,1h  
dhcp-boot=debian-installer/pxelinux.0  
enable-tftp  
tftp-root=/var/lib/tftpboot
```

Restart dnsmasq:

```
systemctl restart dnsmasq.service
```

- ✓ DHCP IP address
- ✓ DNS resolution
- ✓ PXE installer boot
- ✗ web access
- ✗ package cache

IP-Forwarding with shorewall¹

Install shorewall

```
apt install shorewall
```

/etc/default/shorewall

```
-startup=0  
+startup=1
```

/etc/shorewall/shorewall.conf

```
-IP_FORWARDING=Keep  
+IP_FORWARDING=Yes
```

Fetch two-interfaces example configuration:

```
cd /usr/share/doc/shorewall/examples/two-interfaces/  
cp interfaces masq policy rules stoppedrules zones \  
/etc/shorewall/
```

¹Alternative approach: Enable packet forwarding for IPv4 by uncommenting `#net.ipv4.ip_forward=1` in `/etc/sysctl.conf`.

IP-Forwarding with shorewall

Modify /etc/shorewall/policy:

-loc	net	ACCEPT
+loc	all	ACCEPT
+\$FW	all	ACCEPT

Modify /etc/shorewall/rules:

-SSH(ACCEPT)	loc	\$FW
+SSH(ACCEPT)	all	\$FW

- ✓ DHCP IP address
- ✓ DNS resolution
- ✓ PXE installer boot
- ✓ web access
- ✗ package cache

Package Cache: squid

Install squid3

```
apt install squid3
```

/etc/squid3/squid3.conf

```
-#acl localnet src 192.168.0.0/16      # RFC1918 possible internal
+acl localnet src 192.168.0.0/16      # RFC1918 possible internal

-#http_access allow localnet
+http_access allow localnet
  http_access allow localhost

  # maximum_object_size_in_memory 512 KB
+maximum_object_size_in_memory 10240 KB

  # maximum_object_size 4 MB
+maximum_object_size 512 MB

  #cache_dir ufs /var/spool/squid3 100 16 256
+cache_dir aufs /var/spool/squid3 10000 16 256
```

Package Cache: squid

Package cache²/etc/squid3/squid3.conf

```
# Add any of your own refresh_pattern entries above these.
#
+# refresh pattern for debs and udebs
+refresh_pattern deb$    129600 100% 129600
+refresh_pattern udeb$   129600 100% 129600
+refresh_pattern tar.gz$ 129600 100% 129600
+refresh_pattern tar.xz$ 129600 100% 129600
+refresh_pattern tar.bz2$ 129600 100% 129600
+
+# always refresh Packages and Release files
+refresh_pattern \/(Packages|Sources)(|\.bz2|\.gz|\.xz)$ \
                                0 0% 0 refresh-ims
+refresh_pattern \/(Release(|\.gpg))$ 0 0% 0 refresh-ims
+refresh_pattern \/(InRelease)$ 0 0% 0 refresh-ims
```

²<https://sources.debian.net/src/squid-deb-proxy/0.8.11/squid-deb-proxy.conf/>

Intercepting Package Cache

We want the clients to use the package cache transparently³.

```
/etc/shorewall/rules
```

```
ACCEPT          $FW          net          icmp
#
+REDIRECT       loc          3129         tcp          www
```

```
/etc/squid3/squid3.conf
```

```
# Squid normally listens to port 3128
http_port 3128
+http_port 3129 intercept
```

```
Test with: tailf /var/log/squid3/access.log
```

```
... TCP_MISS/200 ... GET http://.../debian-lan-config_0.21_all.deb ...
... TCP_MEM_HIT/200 ... GET http://.../debian-lan-config_0.21_all.deb ...
```

³Without explicitly telling clients to do so.

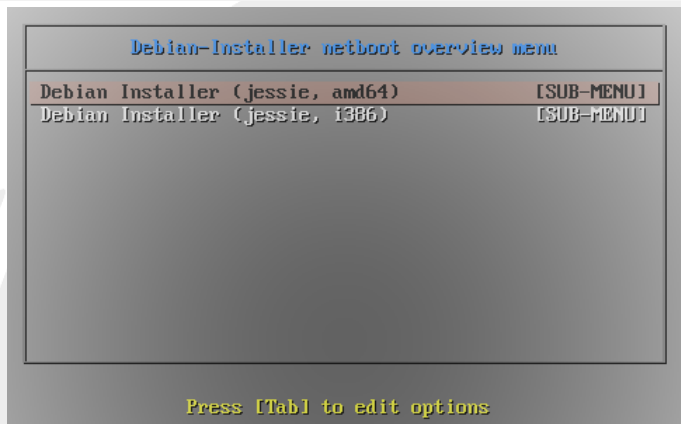

Done!

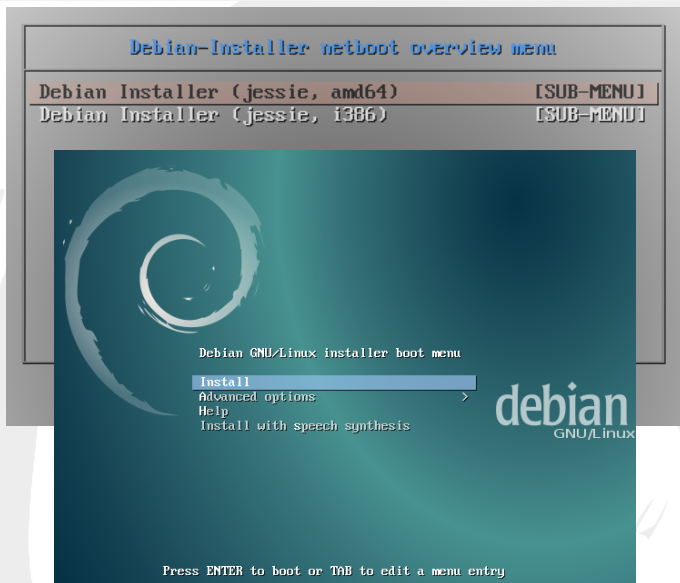

- ✓ DHCP IP address
- ✓ DNS resolution
- ✓ PXE installer boot
- ✓ web access
- ✓ package cache

... PXE Booting the Client ...

... PXE Booting the Client ...

... PXE Booting the Client ...

Debian-Installer netboot overview menu

Squid client requests - from Wed Jun 3 19:48:05 2015 to Wed Jun 3 20:42:32 2015

Press ENTER to boot or TAB to edit a menu entry

A way to set answers to questions asked during the installation process.⁴

⁴<https://www.debian.org/releases/jessie/amd64/apbs01.html.en>

How is it done?

- Prepare a preconfiguration file⁵
- Make it available (http, tftp, ...)
- Tell the installer where and how to fetch the file

Use the InstallBox' TFTP server:

```
cd /var/lib/tftpboot
mkdir -p d-i/jessie/
cp /path/to/preseed.cfg /var/lib/tftpboot/d-i/jessie/
```

Make "installbox" resolvable for the clients:

Modify /etc/hosts:

```
127.0.0.1    localhost
-127.0.1.1  installbox
+127.0.1.1  localhost
+192.168.0.10 installbox
```

⁵<https://www.debian.org/releases/jessie/example-preseed.txt>

How is it done?

- Prepare a preconfiguration file⁵
- Make it available (http, tftp, ...)
- Tell the installer where and how to fetch the file

Use the InstallBox' TFTP server:

```
cd /var/lib/tftpboot
mkdir -p d-i/jessie/
cp /path/to/preseed.cfg /var/lib/tftpboot/d-i/jessie/
```

Make "installbox" resolvable for the clients:

Modify /etc/hosts:

```
127.0.0.1    localhost
-127.0.1.1   installbox
+127.0.1.1   localhost
+192.168.0.10 installbox
```

⁵<https://www.debian.org/releases/jessie/example-preseed.txt>

How is it done?

- Prepare a preconfiguration file⁵
- Make it available (http, tftp, ...)
- Tell the installer where and how to fetch the file

Use the InstallBox' TFTP server:

```
cd /var/lib/tftpboot
mkdir -p d-i/jessie/
cp /path/to/preseed.cfg /var/lib/tftpboot/d-i/jessie/
```

Make "installbox" resolvable for the clients:

Modify /etc/hosts:

```
127.0.0.1      localhost
-127.0.1.1    installbox
+127.0.1.1    localhost
+192.168.0.10 installbox
```

⁵<https://www.debian.org/releases/jessie/example-preseed.txt>

The Preseed File

```
/var/www/html/d-i/jessie/preseed.cfg
```

```
## Skip root account:
```

```
d-i passwd/root-login boolean false
```

```
## Apt setup:
```

```
d-i apt-setup/non-free boolean true
```

```
d-i apt-setup/contrib boolean true
```

```
d-i mirror/http/mirror string ftp-stud.hs-esslingen.de
```

```
d-i mirror/http/mirror seen false
```

```
## Package selection:
```

```
tasksel tasksel/desktop multiselect kde
```

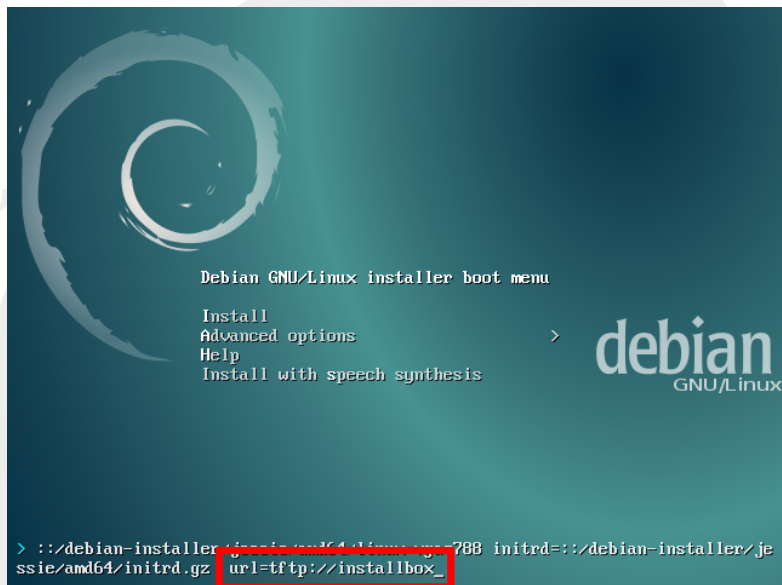

```
## Individual additional packages to install:
```

```
d-i pkgsel/include string firmware-linux xul-ext-adblock-plus
```

```
## This command is run just before the install finishes:
```

```
d-i preseed/late_command string in-target \  
systemctl enable systemd-timesyncd.service
```

Installer Boot Parameter

The image shows a terminal window with a teal background and a white spiral logo in the top left. The text in the terminal is as follows:

```
Debian GNU/Linux installer boot menu

Install
Advanced options >
Help
Install with speech synthesis

> ::/debian-installer/gnu/linux/sgx-788 initrd=::/debian-installer/je
ssie/amd64/initrd.gz url=tftp://installbox_
```

The text `url=tftp://installbox_` is highlighted with a red box.

```

Further Notes

- Preconfiguration files may be specified by the DHCP server⁶.
- Boot parameters can also be used to preseed questions⁷.
- Use the boot parameter “DEBCONF_DEBUG=5” to find variables that need to be preseeded.
- Default values can be modified as well⁸.
- The boot parameters “auto=true priority=critical” delays the locale and keyboard questions until after there has been a chance to preseed them (i.e. until the network is up)⁹.

⁶ <https://www.debian.org/releases/jessie/amd64/apbs02.html.en#preseed-dhcp>

⁷ <https://www.debian.org/releases/jessie/amd64/apbs02.html.en#preseed-bootparms>

⁹ <https://www.debian.org/releases/jessie/amd64/apbs02.html.en#preseed=auto>

Completely Automatic Installation

- Add necessary boot parameters to di-netboot-assistant
- Preseed all questions asked
- Boot preseeded installer entry automatically by default

Modify `/etc/di-netboot-assistant/pxelinux.HEAD`:

```
+LABEL quick
+  MENU LABEL Debian Installer (Jessie ; amd64 + Preseed)
+  kernel ::/debian-installer/jessie/amd64/linux
+  append initrd=::/debian-installer/jessie/amd64/initrd.gz \
          auto=true priority=critical url=tftp://installbox
+TIMEOUT 100
```

Execute:

```
di-netboot-assistant rebuild-menu
```

Done!

```
Debian-Installer netboot overview menu

Debian Installer (Jessie ; amd64 + Preseed)
Debian Installer (jessie, amd64)          [SUB-MENU]
Debian Installer (jessie, i386)          [SUB-MENU]

Press [Tab] to edit options

Automatic boot in 7 seconds...
```

Limitations

Preseeding is fine for more or less standard installations. For more complex configurations, limits are reached:

- Complicated preconfiguration file
- Not very structured, fragile
- Limited logging capabilities
- Inefficient testing
- ...

Solution:

Use a configuration management utility¹⁰ like puppet, chef, ansible, cfengine, ..., or FAI.

¹⁰https://en.wikipedia.org/wiki/Comparison_of_open-source_configuration_management_software

Implemented Services

- DNS and DHCP
- Kerberos KDC
- LDAP
- home directories distributed via kerberized NFSv4
- GOsa for user management
- kerberized local email: exim, dovecot
- intranet (users' homepages)
- ICINGA and Munin system monitoring
- disk quota
- proxy (Squid)
- APT package cache
- local APT repository
- firewall (shorewall)
- etckeeper
- system backup (dirvish)
- network installation / FAI server (PXE)
- ...

Fully Automatic Installation (FAI): Class Concept

files

...

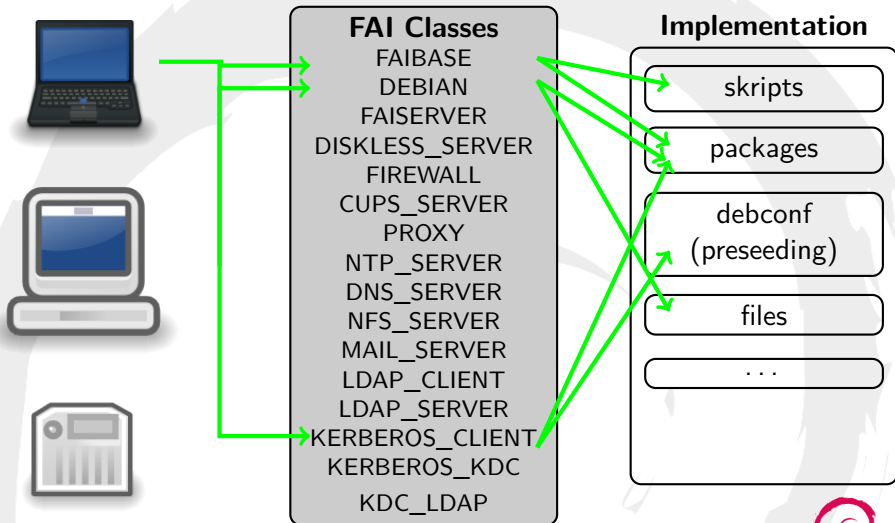

Fully Automatic Installation (FAI): Class Concept

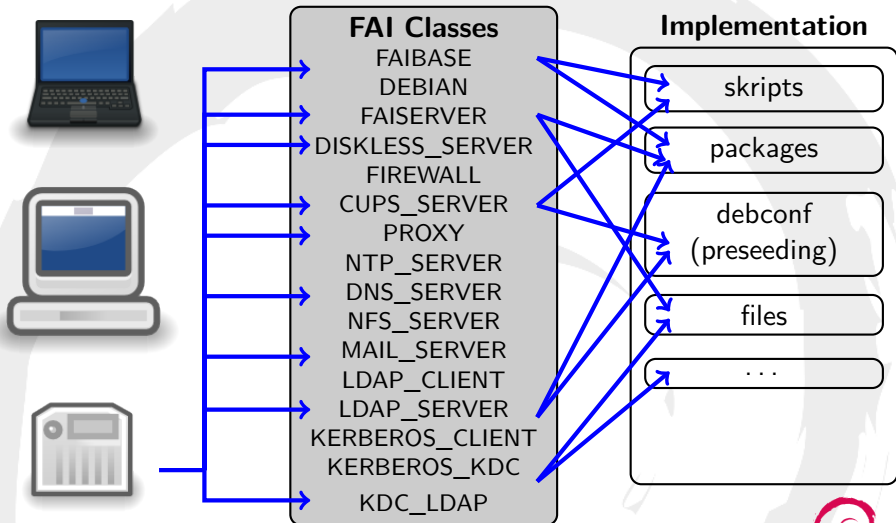

Fully Automatic Installation (FAI): Class Concept

Fully Automatic Installation (FAI): Class Concept

Fully Automatic Installation (FAI): Class Concept

Fully Automatic Installation (FAI): Class Concept

FAI's class concept:

- every hostname is mapped on a set of classes
- classes define the complete setup:
 - ▶ actions (partitioning, package selection, ...)
 - ▶ configuration (debconf, scripts, ...)
- classes are defined in the FAI config space

FAI config space¹² (top level):

```
-- config
|-- class/           (map hostname to classes, define variables)
|-- debconf/        (populate debconf database, preseeding)
|-- disk_config/    (define the hard disk setup)
|-- files/          (files to be copied to the target machine)
|-- hooks/          (hooks to be run during installation)
|-- package_config/ (package selection to be installed)
|-- scripts/        (scripts to be run after installation)
'-- tests/          (final test, verbose logging of actions)
```

¹²The config space is a certain directory structure with [text files](#).

Fully Automatic Installation (FAI): Class Concept

FAI's class concept:

- every hostname is mapped on a set of classes
- classes define the complete setup:
 - ▶ actions (partitioning, package selection, ...)
 - ▶ configuration (debconf, scripts, ...)
- classes are defined in the FAI config space

FAI config space¹² (top level):

```
-- config
|-- class/           (map hostname to classes, define variables)
|-- debconf/        (populate debconf database, preseeding)
|-- disk_config/    (define the hard disk setup)
|-- files/          (files to be copied to the target machine)
|-- hooks/          (hooks to be run during installation)
|-- package_config/ (package selection to be installed)
|-- scripts/        (scripts to be run after installation)
'-- tests/          (final test, verbose logging of actions)
```

¹²The config space is a certain directory structure with text files. ▶ ◀ ◂ ◃ ≡ ≡ ≡ ≡ ≡ ≡ ≡ ≡ ≡ ≡

Fully Automatic Installation (FAI): Examples

Example: The host 'gateway' is associated with the following classes:

```
FAIBASE DEBIAN DHCP FIREWALL GATEWAY_A
```

All packages defined in these classes will be installed and configured accordingly.

Example: What happens to hosts associated with the FIREWALL class?

```
$ find config/ -name FIREWALL
  config/package_config/FIREWALL
  config/scripts/FIREWALL
```

- package 'shorewall' will be installed¹³
- the firewall will be configured¹⁴

The Debian-LAN FAI Classes

The mainserver maps onto the following classes¹⁵ in the Debian-LAN FAI config space:

- | | | |
|-------------------|----------------|--------------------|
| 1 FAIBASE | 8 LOG_SERVER | 15 LDAP_SERVER |
| 2 DEBIAN | 9 PROXY | 16 KERBEROS_CLIENT |
| 3 FAISERVER | 10 NTP_SERVER | 17 KERBEROS_KDC |
| 4 LVM8_A | 11 DNS_SERVER | 18 KDC_LDAP |
| 5 DISKLESS_SERVER | 12 NFS_SERVER | 19 SERVER_A |
| 6 FIREWALL | 13 MAIL_SERVER | 20 GOSA |
| 7 CUPS_SERVER | | |

workstations map onto:

- | | | |
|-----------|---------------|-------------------|
| 1 FAIBASE | 5 CUPS_CLIENT | 9 KERBEROS_CLIENT |
| 2 DEBIAN | 6 LOG_CLIENT | 10 CLIENT_A |
| 3 DHCPD | 7 LDAP_CLIENT | 11 XORG |
| 4 LVM5_A | 8 NFS_CLIENT | 12 DESKTOP |

FAI: install and softupdate Procedure

FAI install

- boot FAI live system (CD/USB or PXE) on the target machine
- mount FAI config space on the live system
- map hostname to set of classes
- install the target machine dependent on its classes:
 - ▶ partition local hard disk
 - ▶ configure packages (debconf database)
 - ▶ install packages
 - ▶ configure target system (run scripts)
- reboot from the local hard disk

FAI softupdate (already installed machine)

- mount FAI config space on the system
- map hostname to set of classes
- dependent on the associated classes:
 - ▶ configure packages (debconf database)
 - ▶ install packages
 - ▶ configure target system (run scripts)

FAI: install and softupdate Procedure

FAI install

- boot FAI live system (CD/USB or PXE) on the target machine
- mount FAI config space on the live system
- map hostname to set of classes
- install the target machine dependent on its classes:

 - ▶ configure packages (debconf database)
 - ▶ install packages
 - ▶ configure target system (run scripts)
- reboot from the local hard disk

FAI softupdate (already installed machine)

- mount FAI config space on the system
- map hostname to set of classes
- dependent on the associated classes:
 - ▶ configure packages (debconf database)
 - ▶ install packages
 - ▶ configure target system (run scripts)

Summary and Conclusions

- Set up your own **InstallBox** with:
`dnsmasq`, `di-netboot-assistant`, `shorewall`, `squid`
and a few lines of configuration.

- Add **preseeding** to get rid of boring questions.
- For more complex installations: Take a look at [FAI](#) and [Debian-LAN](#).

Summary and Conclusions

- Set up your own **InstallBox** with:
`dnsmasq`, `di-netboot-assistant`, `shorewall`, `squid`
and a few lines of configuration.

- Add **preseeding** to get rid of boring questions.
- For more complex installations: Take a look at [FAI](#) and [Debian-LAN](#).
