Custom Debian Distributions
Sense, scope, techniques and future

Andreas Tille

Debian Conference 5

Helsinki, 11. July, 2005
Structure

1. Past
   - Short history
   - Obliged to users
   - Limits to Growth
   - Deriving from Debian

2. Present
   - Grouping of packages
   - Adapting package configuration
   - Documentation

3. Future
   - Technical
   - Structural
Origin

- Debian internal projects
  - Debian-Junior (2000)

- Amongst technical internal projects

- Just grouping packages in meta packages
Evolution

- DebConf 3 renaming: *Custom Debian Distribution*
  - Distinction between technical projects and CDDs
  - Start of technical cooperation
- Forks coming back
  - SkoleLinux became Debian-Edu
  - DeMuDi
Reduce confusion
Customising Debian

- Debian > 10000 packages
- Users interested in *subset*
- Groups of specialised users
- Easy installation and configuration
- **No fork** from Debian

*Basic idea: Do not make a separate distribution but make Debian fit for special purpose instead*
Particular features of Debian

- Maintainer: Missing link between developers and users
- Principles of Free Software at distribution level: Independence of commercial interest of producer
Why including special applications

- Debian becomes larger and larger
  → How many packages are good for Debian?
- Bring special applications under quality control
- Attract wider user base
  → How many packages are good for our users?
Do we scale well?

1. Number of involved people
2. Number of packages
3. Number of architectures
4. Number of bugs
5. Number of users
6. Number of derivatives
7. Time span between releases
8. Number of attendees of Debconf
9. Amount of money sponsored for Debconf
Sub-structuring Debian

- Change of quantity into quality (Hegel)
- To determine at the right moment the critical point where quantity changes into quality is one of the most important and difficult tasks in all the spheres of knowledge (Trotzki)
- Evolution . . . through quantitative transformations passing into qualitative (Darwin principle)

→ CDDs can deal with nearly all dimensions of growth inside Debian
CDD scales well

</tbody>
</table>
Reasons

Commercial reasons
- Add something to Debian
  - Add non-free software
  - Add own installer, desktop configuration, etc.
- Service company needs a brand

Political reasons
- On behalf of government or organisation
- Granted project
Misconceptions about Debian

- Impossible to work together with Debian
- Debian is an inflexible beast
- Ignore possibilities of DoOcracy
Meta packages contain

- Relations to other Debian packages
  - Depends, recommends, suggests
  - Conflicts ?
- User menus
  - Maintained via role based tools
- Configuration
User roles

- Not in the menu == not available
- Reduce menu to interesting part
There are CDD users outside

Thankful user

To: Andreas Tille <tille@debian.org>
Subject: Re: cdd ACCEPTED

Oups! Sorry for the noise, I have misconfigured my debarchiver. :-/

(BTW, many thanks for cdd-dev, I foudn it very usefull! :-) )

Djoume

Explanation

I dont really build a CDD. I’m working in a enginnering school (IFITEP) and I’m switching all PC (a hundred) from Redhat to Debian sarge. Each courses require a set of software, so I’m building a meta-package for each courses (debian-ifitep-java, debian-ifitep-maths, etc..) and adjust the dependency according to the need of the teacher.
I will certainly have to adjust the dependency during the school year (for example if a teacher have forgotten to tell me something) and the best way I have found to keep the PC in sync is to :
- make the meta package as explained before
- make a local repository
- auto-upgrade the PC at boot time and with a cron
With the help of your CDD-HOWTO, I have found it very easy to build meta-package and I’have also decided to make a "private" meta-package with a selection of packages I can’t live without and use it when I made a new debian install.
Debconf

- Relay on package maintainer
- Cope with overworked / lazy / stubborn maintainers
- Group maintenance
Cfengine

- Fall-back if *debconf* not possible
- Give local admin helping hand
- Problems on upgrades might be solved by *cddtk*
  - Wrapper around apt
  - Store original config files
  - Move these in place before upgrades
  - Redo CDD specific configuration
Obliged to end users

- **CDD documentation**
- Web-tools
  - Currently nothing
  - Possibility to do basic things automatically
- Very different between CDDs
CDD toolkit

**New generation toolkit**
- Replace `cdd-dev` to build meta packages
- Alternatively resolve dependencies without meta packages
- Techniques for simple configuration
Live-CDs and installers

- Live CD – nice to have
- Perfect to show off
- For *real* work: installer
- Make it “user-just-pressing-enter” like
Documentation

- Better web presence
  - Automatically graphing dependency map
  - Unified web pages
  - Enhancing visibility
- Bug Tracking System
  - Tag WNPP bugs
  - Idea: View on BTS for CDD dependencies
  - Enhanced CDD-centric BTS user interface
- User documentation
Future of Debian

- CDD solve structural problems inside Debian
- Fit user interests
- Makes Debian stronger if done the right way

Also known as: The last, final step towards Total World Domination!
